

oil cooler

Posted by rd7839 - 27 May 2012 19:05

After overheating again at Thunderhill, I think it's time to work on my cooling system. Right now my oil cooler is in front of the radiator and I want to move it. Can you guys give me pointers as to the best spot and how to duct air to it? Lots of pictures will help.

Also want to add a turbo radiator. How hard is it to get it in a '86 and is it legal?

Thanks

Ron

Thanks Joe. Do you ever worry about hitting it on something?

No. It is right near the radiator and is subject to the same dangers. Once I put the front end into a tire wall. No damage other than pushing the mounts back. No damage to radiator or cooler.
